## **Executive Summary**

The following report presents the findings of a Transportation Impact Study (TIS) conducted for the proposed 4131 Chain Bridge Road development in the City of Fairfax, Virginia. This study was developed in accordance with guidelines and recommendations set forth by the City of Fairfax.

This study was prepared in accordance with the best professional practices and standards in order to assess the impact of the proposed development on the surrounding transportation systems and recommend improvements to lessen or negate those impacts. This study involves the evaluation of anticipated roadway conditions with and without the proposed development and recommends possible transportation improvements and strategies to offset both the impacts of the increase in future traffic demand and the changes in traffic operations and characteristics due to the development. This study serves to assist public officials and developers in balancing interrelations between efficient traffic movements with necessary access.

#### Site Location and Study Area

The proposed development will be located between the eastern frontage of Chain Bridge Road (Route 123) at Judicial Drive and the western frontage of University Drive (Route 6627) at Breckinridge Lane, to the north of Armstrong Street, in the City of Fairfax, Virginia.

For this study, the analysis presented herein includes five existing intersections and two future intersections.

The study intersections are as follows:

- 1. University Boulevard (Route 6627) at Breckinridge Lane
- 2. University Boulevard (Route 6627) at Armstrong Street
- 3. Chain Bridge Road (Route 123) at West Drive
- 4. Chain Bridge Road (Route 123) at Armstrong Street
- 5. Chain Bridge Road (Route 123) at Judicial Drive
- 6. Chain Bridge Road (Route 123) at New Service Drive
- 7. University Boulevard (Route 6627) at New Service Drive

#### **Description of Proposed Development**

The proposed site is situated on one approximately 2.67-acre parcel of land that can be identified on the City of Fairfax Real Estate Assessment Database with the following Tax Map #: 57-4-02-040. The parcel is currently zoned as RM (Residential Medium) with a Future Land Use of Activity Center, per the Future Land Use Map of the 2035 Comprehensive Plan. Currently, a single-family home is built on the parcel (Davies Property). It should be noted that the trips associated with the existing single-family home were not removed in the analysis.

The proposed site is a mixed-use development consisting of approximately 355 multi-family residential apartment dwelling units, and approximately 4,810 square feet of retail use, along with an approximately 494-space three-level structured garage. The development of the site is anticipated to be complete by 2026.

#### **Principal Findings and Conclusions**

Discussions regarding the study assumptions and relevant background information were held with the City of Fairfax staff during a scoping meeting on April 20, 2023. A copy of the scoping document is included in Appendix A.

The analysis presented in this report supports the following major finding:

The intersection capacity analysis results for the Future Conditions wit Development are similar to Existing and Future
Conditions without Development. Therefore, the development will have a minimal impact on the traffic operations and
safety of the street network.

Additional assumptions, findings, and conclusions are as follows:

#### TIA Components

- As determined based on discussions with the City, 1.0% regional growth was applied to the Chain Bridge Road / University Drive mainline through movements at the intersection of Chain Bridge Road at Judicial Street as well as at the intersection of University Boulevard/George Mason Boulevard at Armstrong Street volumes.
- A mode split/TDM reduction of 15 percent was applied to the residential uses, as agreed upon with the City.
- The internal trip reduction is based on the smaller of 15 percent trips between residential and commercial uses, as agreed upon with the City.
- The proposed development is anticipated to generate approximately 133 new trips during the AM peak hour, 143 new trips during the PM peak hour, and 1,650 new daily trips on a typical weekday.

#### Infrastructure

- Existing vehicular access is provided via one driveway on Chain Bridge Road.
- Access to the site will be provided via two partial-movement right-in/right-out (RIRO) entrances, one along Chain Bridge
   Road and University Drive each, connected via an internal new service drive on-site.

#### Non-SOV Elements

Five bus routes provide service in the vicinity of the site, providing regional access to the area.

#### Analysis Results

- Three intersections within the study area operate below acceptable levels of service under Existing Conditions (2023), and the same intersections continue to operate below acceptable levels of service under Future Conditions without Development (2026) and Future Conditions with Development (2026).
- The intersection capacity analysis results for the Future Conditions with and without Development are similar to Existing Conditions.
- Based on the queuing analysis performed for Future Conditions with Development, the turning movements at the study
  intersections are anticipated to have 95<sup>th</sup> percentile queues that can be accommodated within the available storage
  lengths of the turn bays for all the scenarios.
- It is to be noted that no signal timing adjustment has been proposed as a mitigation measure for the signalized intersections along Chain Bridge Road. This is because all signals along Chain Bridge Road are coordinated and the side street movements run under split phasing. Any adjustment would impact the overall performance of the adjacent intersection and the entire corridor. The side street delays are typical for commuter corridors in Northern Virginia and reflect the prioritization of traffic along the mainlines in order to accommodate the largest possible volume in the area. Therefore, the corridor has a better overall traffic operation than prioritizing all movements equally.

#### Introduction

The following report presents the findings of a Transportation Impact Study (TIS) conducted for the proposed development of the 4131 Chain Bridge Road in the City of Fairfax, Virginia. This study was developed in accordance with guidelines and recommendations set forth by the City of Fairfax.

The proposed program is a mixed-use development consisting of approximately 355 multi-family residential apartment dwelling units, and approximately 4,810 square feet of retail use, along with an approximately 494-space three-level structured garage. The development of the site is anticipated to be complete by 2026.

The following tasks were completed as part of this study effort:

- A scoping meeting was held with the City of Fairfax on April 20, 2023, which included discussions about the parameters of the study and relevant background information. A copy of the signed scoping document is included in Appendix A.
- Existing conditions were observed in the field to verify roadway geometry, pedestrian and bicycle infrastructure, and traffic flow characteristics.
- Turning movement counts were collected at the study area intersections on Tuesday, April 25, 2023, during the morning and afternoon peak periods.
- Vehicular traffic analysis for the study intersections was performed using Synchro 11 based on Highway Capacity Manual (HCM) 6<sup>th</sup> Edition methodology. HCM 2000 methodology was used if HCM 6<sup>th</sup> Edition was not applicable.
- Intersection capacity analyses were performed for the 2023 existing year, 2026 Future Conditions without Development, and 2026 Future Conditions with Development.
- Future traffic volumes were developed by accounting for regional growth in the area and background developments
  and roadway improvements. A growth rate of 1.0% per year regional growth was applied to the Chain Bridge Road /
  University Drive mainline through movements at the intersection of Chain Bridge Road at Judicial Street as well as at
  the intersection of University Boulevard/George Mason Boulevard at Armstrong Street for the period between 2023 and
  2026.
- Proposed site traffic volumes were generated based on the methodology outlined in ITE Trip Generation, 11th Edition.
- An assessment of the previous crashes has been conducted at existing study intersections.

Sources of data for this study include the Institute of Transportation Engineers (ITE), the City of Fairfax, the Virginia Department of Transportation (VDOT), and the office files and field reconnaissance efforts by Gorove Slade.

## Background Information: Existing Development and Nearby

#### Description of the Existing Site

#### Site Location

The proposed development will be located between the eastern frontage of Chain Bridge Road (Route 123) at Judicial Drive and the western frontage of University Drive (Route 6627) at Breckinridge Lane, to the north of Armstrong Street, in the City of Fairfax, Virginia

The geographic scope of the study area was developed in accordance with City of Fairfax guidance. Figure 1 shows the location of existing and future study intersections.

Figure 1: Study Intersections

#### Description of the Parcel

The proposed site is situated on one approximately 2.67-acre parcel of land that can be identified on the City of Fairfax Real Estate Assessment Database with the following Tax Map #: 57-4-02-040. The parcel map is shown in Figure 2.

Figure 2: Parcel Map

#### Location within Jurisdiction and Region

The site is located between the eastern frontage of Chain Bridge Road (Route 123) at Judicial Drive and the western frontage of University Drive (Route 6627) at Breckinridge Lane, to the north of Armstrong Street, in the City of Fairfax, Virginia as shown in Figure 3.

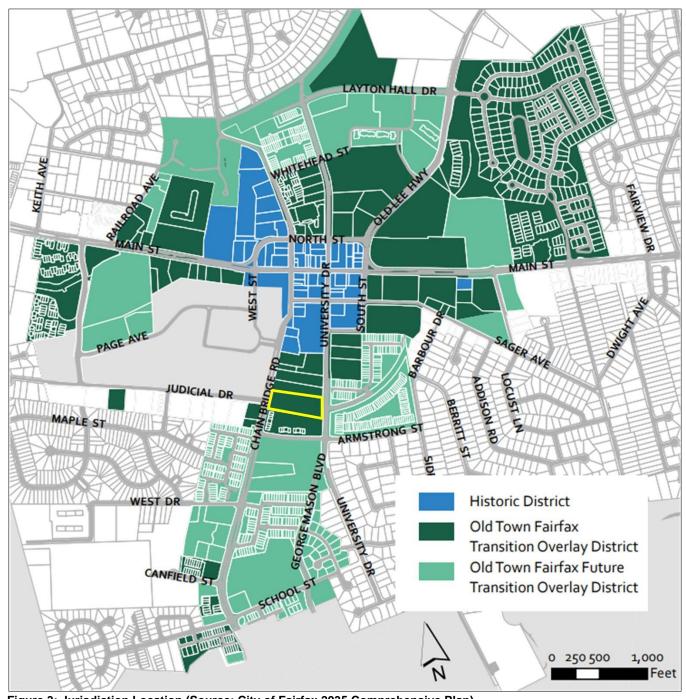

Figure 3: Jurisdiction Location (Source: City of Fairfax 2035 Comprehensive Plan)

#### Comprehensive Plan Recommendations

According to the City of Fairfax 2035 Comprehensive Plan, this site is planned for the Activity Center Place Type (ACPT). The ACPT applies to locations in the City where pedestrian-oriented, mixed-use development is strongly encouraged. The Old Town Fairfax Activity Center encompasses a cultural hub for the City, with a concentration of historic buildings, public services, active open space, and commercial buildings. Old Town Fairfax can also capitalize on its proximity to George Mason University to attract university supported businesses and arts and entertainment venues.

## Zoning for the Site and Nearby Uses

The existing zoning for the site is RM (Residential Medium) as shown in Figure 4.

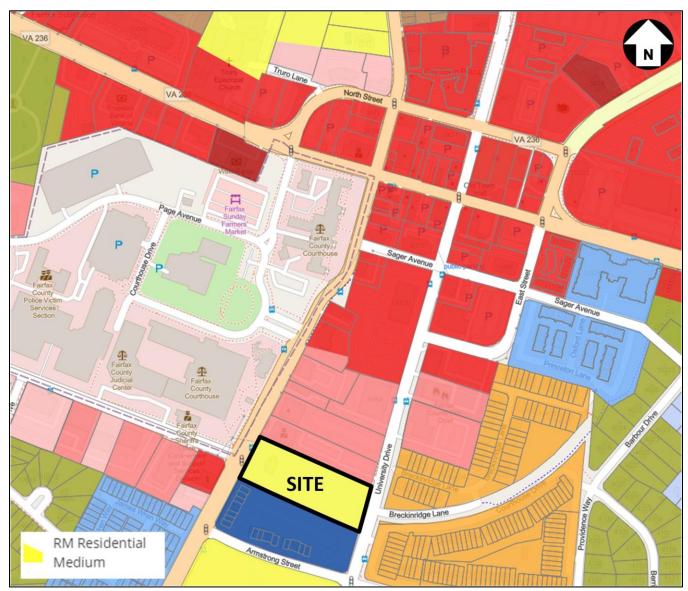

Figure 4: Zoning Map

#### Description of Geometric Scope and Limits of the Study Area

The geographic scope of the study area was developed in accordance with the City of Fairfax guidance.

#### Existing Roadways

The site is located between the eastern frontage of Chain Bridge Road (Route 123) at Judicial Drive and the western frontage of University Drive (Route 6627) at Breckinridge Lane, to the north of Armstrong Street, in the City of Fairfax, Virginia

The existing study area includes five existing intersections along Chain Bridge Road and University Drive.

Detailed roadway descriptions are provided in the 2023 Existing Conditions section of this study.

The vehicular study area includes the following existing intersections:

- 1. University Boulevard (Route 6627) at Breckinridge Lane
- 2. University Boulevard (Route 6627) at Armstrong Street
- 3. Chain Bridge Road (Route 123) at West Drive
- 4. Chain Bridge Road (Route 123) at Armstrong Street
- 5. Chain Bridge Road (Route 123) at Judicial Drive

#### Planned Future Transportation Improvements

#### South Street Extension

The City's recommended extension of South Street to West Street between University Drive and Chain Bridge Road will reroute traffic and relieve congestion on Main Street through Old Town. The extension will also permit the continuation of pedestrian facilities through Old Town. The proposed South Street Extension will provide access to the City Centre site, and as such, will be completed as part of the development of the City Centre site.

While the extension is aligned with the City's plans, the completion date remains uncertain pending funding allocation. The traffic volumes and analysis contained herein are based on the assumption that the South Street extension will be completed by 2026, consistent with the site access plans for the City Centre redevelopment.

#### Old Town Streetscape Plan & Standards and Main Street Streetscape Design

The Main Street Streetscape Design is part of an overall effort to prepare an Old Town Streetscape Plan and Standards that would improve the appearance and experience of Old Town Fairfax as a destination. These improvements are to be completed by others.

#### Transit Improvements

According to the City of Fairfax 2035 Comprehensive Plan, bus improvements and bus transfer improvements are proposed in the vicinity of the site. Figure 5 shows the City's proposed transit network enhancements.

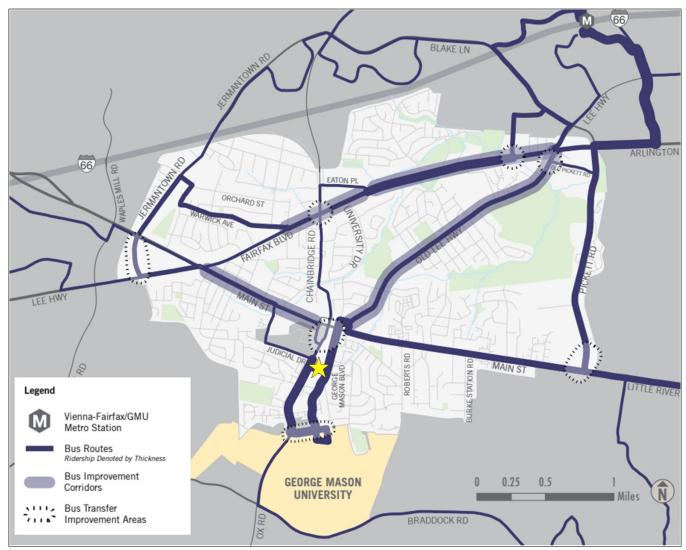

Figure 5: Proposed Transit Network Enhancements (Source: City of Fairfax 2035 Comprehensive Plan)

#### Bicycle and Pedestrian Improvements

According to the City of Fairfax 2035 Comprehensive Plan, on-street bike facilities and concentrated bicycle supportive infrastructure are proposed along and near Main Street and University Drive in the vicinity of the site. Figure 6 shows the City's proposed network for bicycle travel.

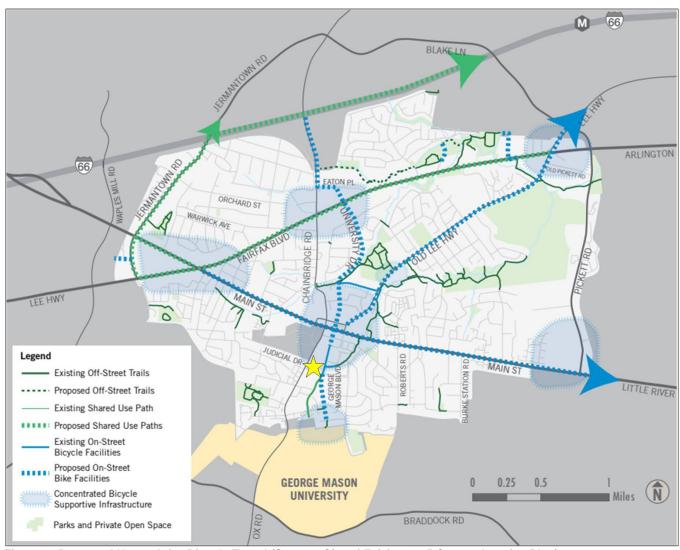

Figure 6: Proposed Network for Bicycle Travel (Source: City of Fairfax 2035 Comprehensive Plan)

## Existing Conditions (2023)

In order to project future traffic conditions, it was necessary to create an existing scenario.

A site visit was conducted in order to capture existing conditions along the site perimeter and written descriptions of the conditions observed, noting any deficiencies and substandard conditions of the multimodal facilities present or lacking.

The site visit, which involved documenting elements within up to a half-mile radius in the vicinity of the site, occurred on Thursday, July 13, 2023.

The site visit indicates locations to improve the multimodal connectivity aspects in and around the site and provides suggestions to improve upon any discontinuous facility segments, lack of crosswalks, or other places with low levels of comfort in the vicinity of the site.

#### **Existing Transit Service**

Five bus routes currently serve the site area on Main Street, Chain Bridge Road (Route 123), and University Drive. Bus service is provided by the City of Fairfax CUE Gold and Green Routes, Metrobus Routes 29K and 17G, and Fairfax Connector Route 306. The existing bus routes are shown in Figure 7 through Figure 10.

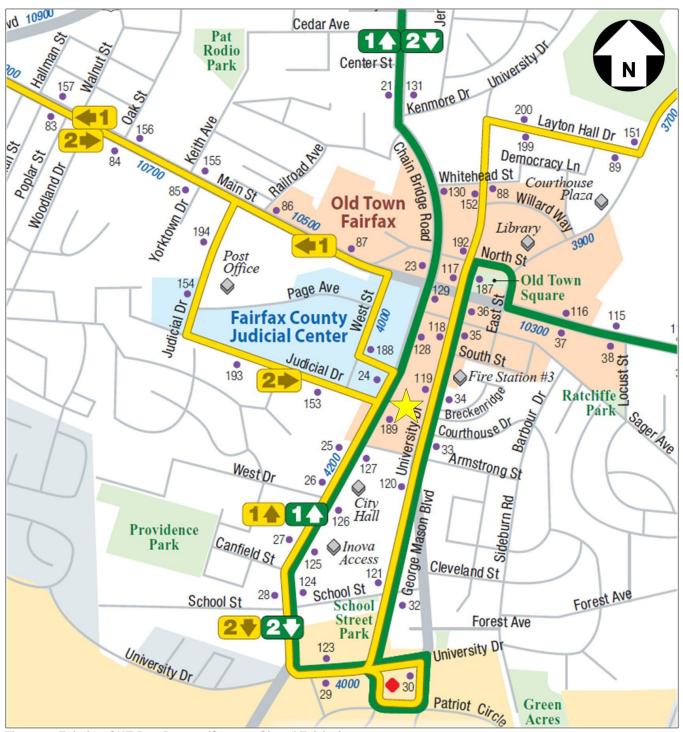

Figure 7: Existing CUE Bus Routes (Source: City of Fairfax)

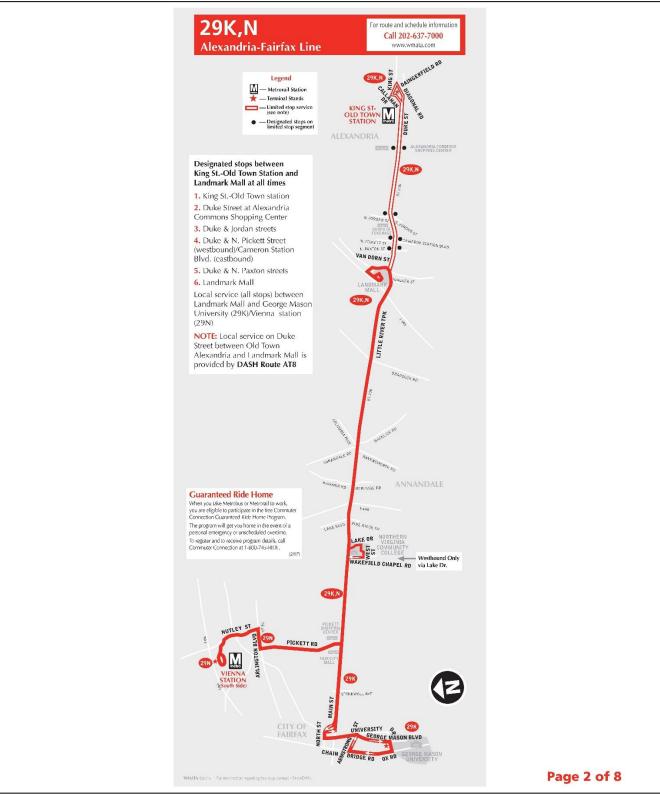

Figure 8: Existing Metrobus Route 29G (Source: WMATA)

Figure 9: Existing Metrobus Route 17G (Source: WMATA)

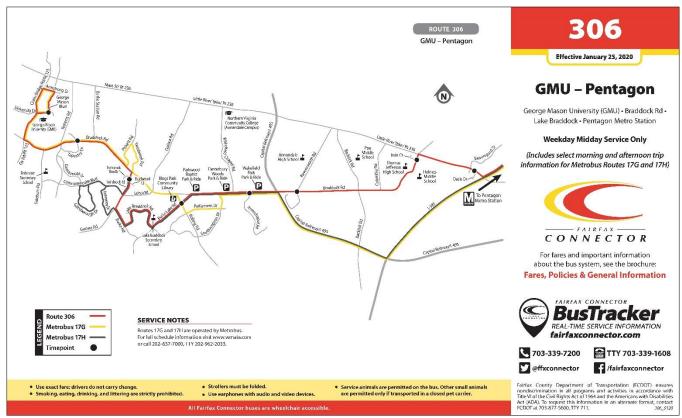

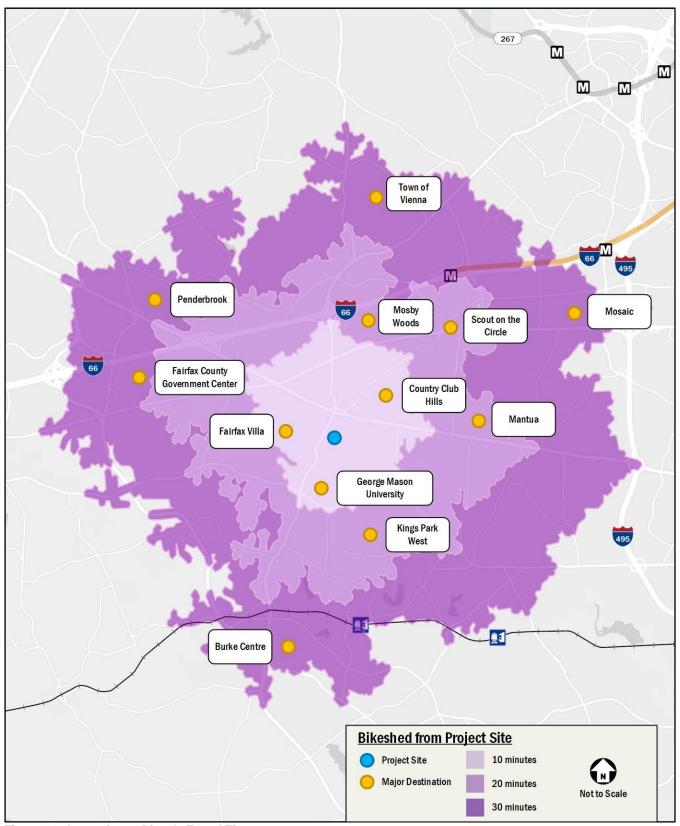

Figure 10: Existing Fairfax Connector Route 306 (Source: Fairfax Connector)

#### Existing Bicycle Facilities

The roadways adjacent to the site are considered comfortable bicycling routes per the Fairfax County Bicycle Map (which includes the City of Fairfax). Sager Avenue is considered "Most Comfortable", University Drive is considered "Somewhat Comfortable", and Chain Bridge Road is considered "Less Comfortable". Main Street is considered a "Use Caution" bicycling route.

The 10-minute, 20-minute, and 30-minute bicycle travel shed for the proposed development is shown in Figure 11. Within a 10-minute bicycle ride, the proposed development has access to several destinations including George Mason University, public transportation stops, residential neighborhoods, retail zones, and community amenities. Within a 20-minute bicycle ride, the proposed development has access to destinations in Fairfax County including residential neighborhoods and retail zones. Within a 30-minute bicycle ride, the proposed development has access to the Town of Vienna, the Mosaic District, and is accessible to the Vienna/Fairfax-GMU Metro Station served by the Orange Line and the Burke Centre Amtrak/VRE Station.

**Figure 11: Approximate Bicycle Travel Times** 

#### Existing Pedestrian Facilities

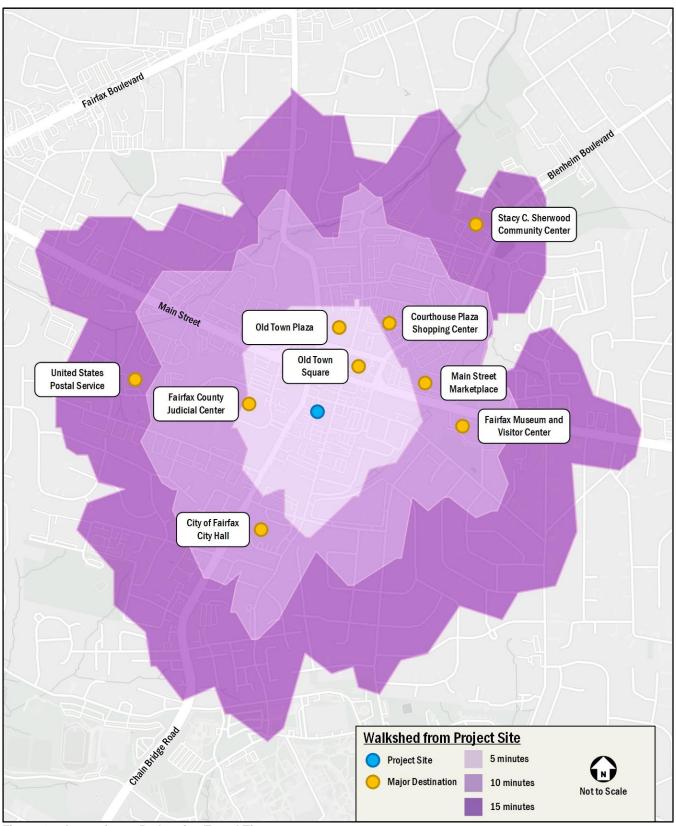

Sidewalks and curb ramps generally exist along the corridors adjacent to and within the vicinity of the site. Sidewalks exist on one side of Chain Bridge Road and both sides of University Drive and Sager Avenue along the perimeter of the site, but most driveways lack crosswalks. The signalized intersection of University Drive & Sager Avenue has marked crosswalks with pedestrian signal heads and call buttons in place. The unsignalized intersections of Chain Bridge Road & Sager Avenue and University Drive & Fairfax Volunteer Fire Department Entrance have marked crosswalks in place.

The existing pedestrian infrastructure facilities, including curb ramps, marked striped crossings, and any observed deficiencies are depicted in Figure 12. Of note, this graphic includes these items within a quarter-mile radius walkshed of the site.

The 10-minute, 20-minute, and 30-minute walk travel shed for the proposed development is shown in Figure 13. Within a 10-minute walk, the proposed development has access to several destinations including the Fairfax County Judicial Center, the City of Fairfax Regional Library, public transportation stops, nearby residential neighborhoods, and retail zones. Within a 20-minute walk, the proposed development has access to destinations including City Hall, residential neighborhoods, and retail zones. Within a 30-minute walk, the proposed development has access to destinations including the Stacy C. Sherwood Community Center, United States Postal Service, and residential neighborhoods.

Figure 12: Existing Pedestrian Facilities

**Figure 13: Approximate Pedestrian Travel Times** 

#### **Existing Roadway Network**

A description of the major roadways within the study area is presented in Table 1. The existing lane configurations and traffic control devices at the study intersections are shown in Figure 14.

**Table 1: Existing Road Network** 

Roadway	From	То	VDOT Classification	Lanes	Speed (mph)	On-Street Parking	AADT (vpd)*	
Chain Bridge Road	SCL Fairfax	Judicial Drive	Other Principal Arterial	4	30	No	28,000	
Chain Bridge Road	Judicial Drive	Main Street	Other Principal Arterial	4	30	No	22,000	
Judicial Drive	Page Avenue	Chain Bridge Road	Major Collector	2	25	No	9,000	
University Drive	SCL Fairfax	Armstrong St	Major Collector	4	25	No	10,000	
University Drive	Armstrong St	South St	Major Collector	4	25	No	15,000	
University Drive	South St	SR 236 Main St	Major Collector	4	25	No	11,000	
* VDOT 2019 Annual Average Daily Traffic (AADT) Data								

#### **Existing Traffic Volumes**

Turning movement counts were collected at the study area intersections on Tuesday, April 25, 2023. Analysis of the traffic data found the following system peak hours:

- Weekday Morning (AM) Peak Hour: 7:45 AM to 8:45 AM
- Weekday Afternoon (PM) Peak Hour: 4:15 AM to 5:15 PM

The existing peak hour traffic volumes for the study area intersections are presented in Figure 15. The raw existing turning movement counts are included in Appendix B.

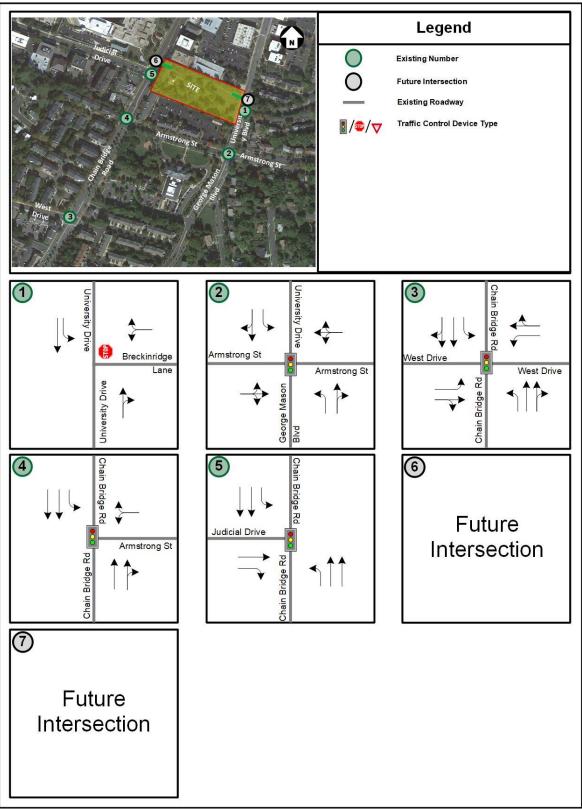

Figure 14: Existing (2023) – Lane Configuration

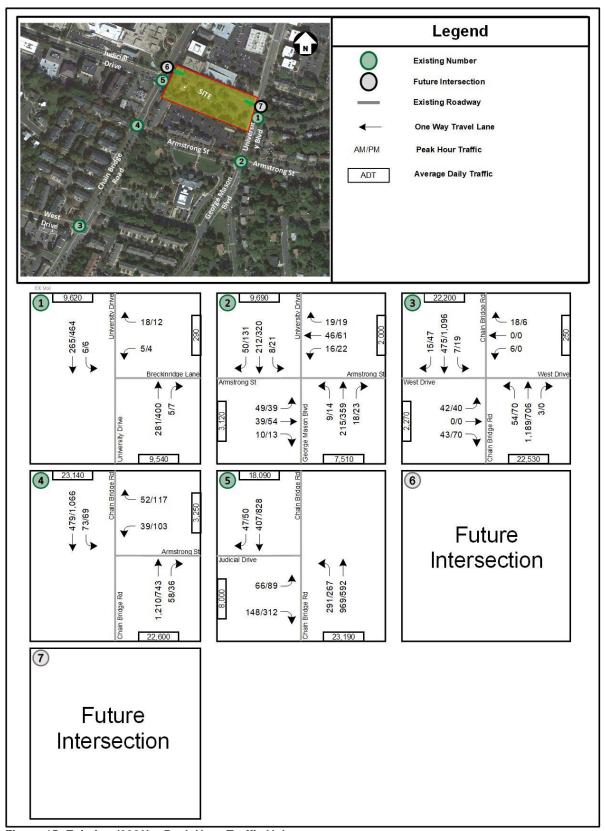

Figure 15: Existing (2023) – Peak Hour Traffic Volumes

#### Existing (2023) Intersection Analysis

Intersection capacity analysis was performed at the intersections within the study area during the weekday AM and weekday PM hours under Existing Conditions (2023). *Synchro Version 11* was used to analyze the study intersections based on the HCM 6<sup>th</sup> edition, and if the output is not available, HCM 2000 methodology presented in the Transportation Research Board's (TRB) Highway Capacity Manual (HCM) and analysis guidelines provided in VDOT's Traffic Operations and Safety Analysis Manual (TOSAM). The analysis herein includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

Existing signal timings were provided by the city and used as a base for the existing analysis. Existing peak hour factors found in the field were used, except where the field peak hour factor was lower than 0.85 in which case a minimum value of 0.85 was used, consistent with VDOT analysis guidelines. As discussed in the scope, the heavy vehicle percentages (HV%) were based on the existing counts and a default *Synchro* HV% of 2.0% was utilized for all other lane groups.

Per the scoping meeting with the City staff, it would be considered acceptable and/or desirable to achieve an approach LOS D or better for traffic operations using HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 2 and graphically in Figure 16. The results are expressed in LOS and delay (seconds per vehicle) for overall signalized intersections and per approach and lane group for all study intersections. The overall signalized intersections and any approaches that operate at LOS E or F are displayed in red.

The 95<sup>th</sup> percentile queues were also determined from *Synchro* and are expressed in feet. The lane groups where the queue lengths exceeded the available effective storage capacity of existing turn lanes are displayed in red.

The description of different LOS and delay are included in Appendix C. The detailed analysis worksheets of 2026 Existing Conditions are contained in Appendix D.

Table 2: Existing (2023) - Intersection Analysis

				AM Peak H		PM Peak Hour		
No.	Intersection (Movement)	Effective Storage Length (ft.) <sup>[1]</sup>	LOS	Delay (sec/veh)	95th % Queue (ft.) <sup>[2] [3]</sup>	LOS	Delay (sec/veh)	95th % Queue [2] [3]

NOTES:

The intersection capacity analysis results show that the following three intersections have one or more approaches that operate below acceptable levels of service during one or more peak hours under Existing Conditions (2023):

• Intersection 3: Chain Bridge Road and West Drive

<sup>[1]</sup> Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

<sup>[2] #: 95</sup>th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.

<sup>[3]</sup> m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

- Eastbound Approach (AM and PM Peaks)
- o Westbound Approach (AM and PM Peaks)
- Intersection 4: Chain Bridge Road and Armstrong Street
  - Westbound Approach (AM and PM Peaks)
- Intersection 5: Chain Bridge Road and Judicial Drive
  - o Eastbound Approach (AM Peak)

Based on the queuing analysis performed for existing conditions, the turning movements at the study intersections are anticipated to have 95<sup>th</sup> percentile queues that can be accommodated within the available storage lengths of the turn bays.

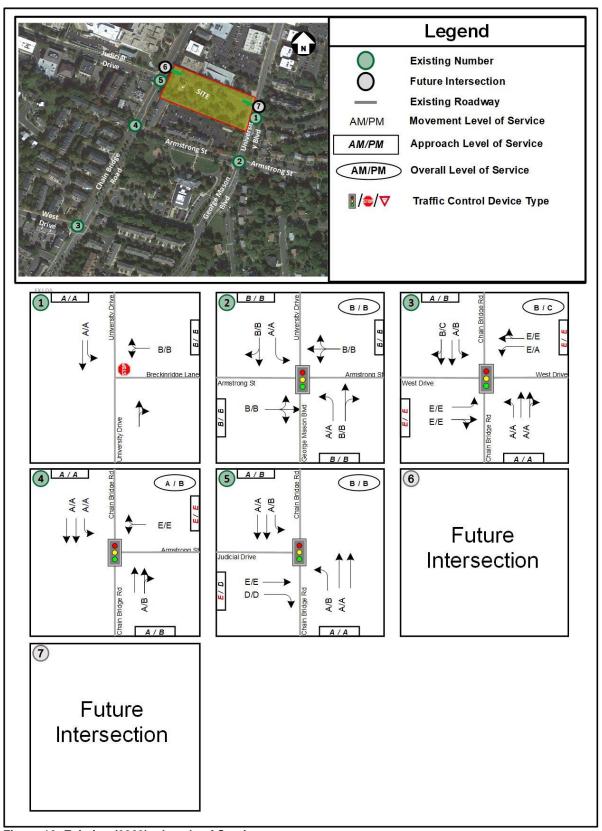

Figure 16: Existing (2023) - Levels of Service

## Future Conditions without Development (2026)

#### Future Conditions without Development (2026) Traffic Volumes

The proposed 4131 Chain Bridge Road development is anticipated to be complete in 2026. The future background traffic volumes were projected by increasing the existing volumes to 2026 using an inherent growth rate. Historical ADT data is shown in Table 3. As determined based on discussions with the City, a 1.0% per year regional growth was applied to the Chain Bridge Road / University Drive mainline through movements at the intersection of Chain Bridge Road at Judicial Street as well as at the intersection of University Boulevard/George Mason Boulevard at Armstrong Street as shown in Figure 17.

**Table 3: Historical Growth Rate** 

					AAI	T			Annual % Change	Annual % Change (2015-2021)
Route	From	То	2015	2016	2017	2018	2019	2021	(2015-2019)	
Chain Bridge Road	SCL Fairfax	Judicial Drive	26,000	27,000	28,000	28,000	28,000	24,000	1.9%	-2.3%
Chain Bridge Road	Judicial Drive	Main Street	20,000	21,000	21,000	21,000	22,000	14,000	2.4%	-7.8%

Source: VDOT Traffic Data (http://www.virginiadot.org/info/ct-trafficcounts.asp)										

In addition to the regional background growth, two planned developments in the vicinity of the site were taken into consideration. As discussed at the scoping meeting, the following developments were included in the 2026 analysis:

- One University One University is a 10.8-acre site located adjacent to the George Mason University campus in Fairfax
  County. For the purposes of this analysis, the One University site was anticipated to build 240 affordable senior
  independent dwelling units and 333 student housing dwelling units by 2026.
- Fairfax County Judicial Complex The Judicial Complex is a 47.8-acre portion of Fairfax County surrounded by the City of Fairfax. A new Master Plan for the complex was completed in January 2021. Phase One of the redevelopment project was assumed to be in place by 2026. For the purposes of this analysis, Phase One was anticipated to include 43,605 SF of storage uses and 80,892 SF of office uses. It should be noted that traffic impact study for the Fairfax County Judicial Complex redevelopment has not yet been submitted. However, the land uses and sizes outlined in the Judicial Complex Master Plan were utilized to model projected traffic volumes from this site.

The background growth is shown in Figure 17 and the background development volumes for One University and Fairfax County Judicial Complex are shown in Figure 18 and Figure 19, respectively. The total background development volumes is shown in Figure 20. The details outlining the methodologies for volume calculation are provided in Appendix E.

The trips generated by background growth and background development were added to the existing volumes in order to generate Future Conditions without Development (2026) traffic volumes presented in Figure 21.

Figure 17: Background Growth (2023 - 2026)

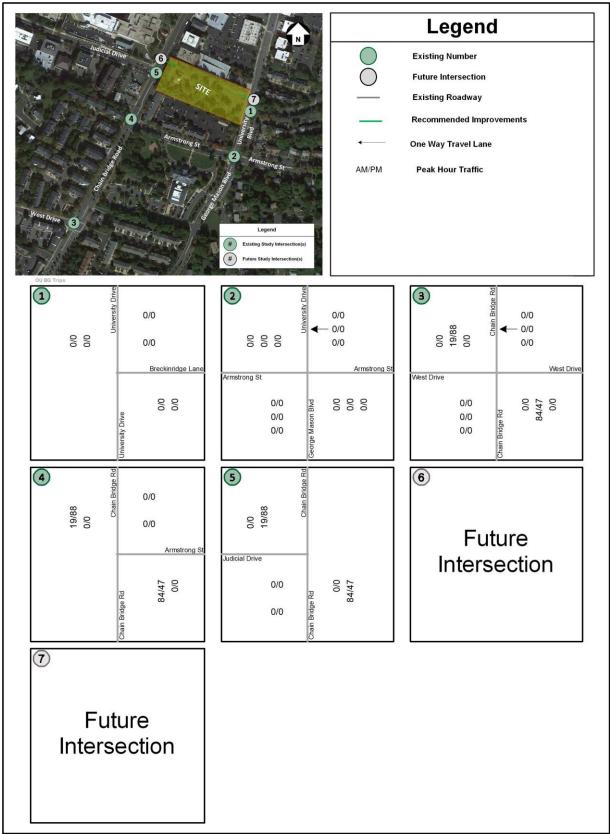

Figure 18: One University Background Development Net Trips

Figure 19: Phase 1 of FCJC Background Development Net Trips

Figure 20: Total Background Development Trips<sup>1</sup>

<sup>&</sup>lt;sup>1</sup> Note: The volumes above reflect a total of the rerouting of existing trips, addition of pass-by trips of the background developments, and addition of the background development site trips, consistent with methodology of the respective traffic studies; therefore, volumes presented above may be shown as negative. Detailed informations and assumptions are provided in the Appendix E..

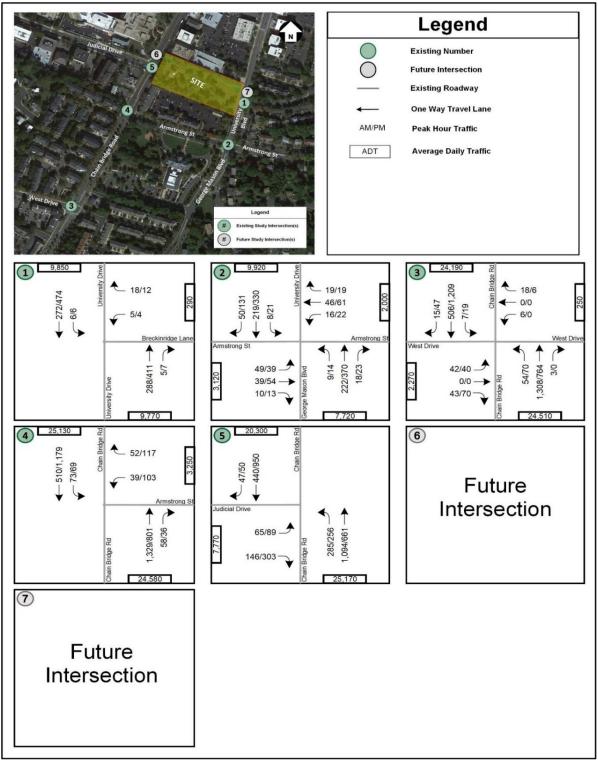

Figure 21: Future without Development (2026) – Peak Hour Traffic Volumes

#### Future without Development (2026) Intersection Analysis

Intersection capacity analysis was performed at the intersections within the study area during the weekday AM and weekday PM hours under Future Conditions without Development (2026). *Synchro Version 11* was used to analyze the study intersections based on the HCM 6<sup>th</sup> edition, and if the output is not available, the HCM 2000 methodology presented in the Transportation Research Board's (TRB) Highway Capacity Manual (HCM) and analysis guidelines provided in VDOT's Traffic Operations and Safety Analysis Manual (TOSAM). The analysis herein includes the level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

Signal phasing and timings were not changed from the existing conditions. A peak hour factor of 0.92 was used unless the peak hour collected in the field was higher. As discussed in the scope, the heavy vehicle percentages (HV%) were based on the existing counts and a default *Synchro* HV% of 2.0% was utilized for all other lane groups.

Per the scoping meeting with the City staff, it would be considered acceptable and/or desirable to achieve an approach LOS D or better for traffic operations using HCM methodology. The results of the intersection capacity analysis are presented in Table 4 and are expressed in LOS and delay (seconds per vehicle) per lane group. Level of service results are also presented in Figure 22. The detailed analysis worksheets are included in Appendix F.

NOTES:

- [1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.
- [2] #: 95th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.
- [3] m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

The intersection capacity analysis results show that the following three intersections have movements that operate below acceptable levels of service during one or more peak hours under Future Conditions without Development (2026):

- Intersection 3: Chain Bridge Road and West Drive
  - o Eastbound Approach (AM and PM Peaks)
  - Westbound Approach (AM and PM Peaks)
- Intersection 4: Chain Bridge Road and Armstrong Street
  - Westbound Approach (AM and PM Peaks)
- Intersection 5: Chain Bridge Road and Judicial Drive
  - Eastbound Approach (AM Peak)

The intersection capacity analysis results are similar to existing conditions. The same three intersections that currently operate below acceptable levels of service are expected to continue to operate unacceptably under Future Conditions without Development (2026).

Based on the queuing analysis performed for the future conditions without development, the turning movements at the study intersections are anticipated to have 95<sup>th</sup> percentile queues that can be accommodated within the available storage lengths of the turn bays.

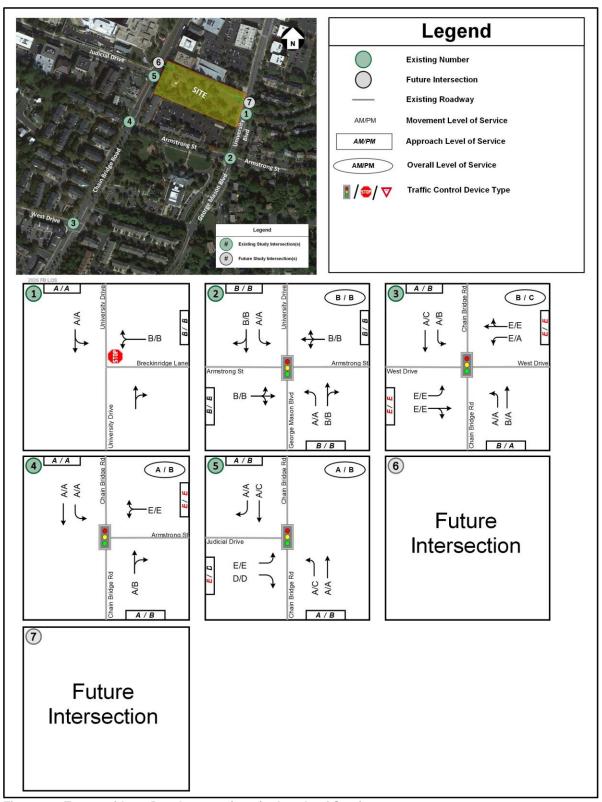

Figure 22: Future without Development (2026) - Levels of Service

# Future Conditions with Development (2026)

#### Site Description

The proposed site is a mixed-use development consisting of approximately 355 multi-family residential apartment dwelling units, and approximately 4,810 square feet of retail use, along with an approximately 494-space multi-level structured garage. The development of the site is anticipated to be complete by 2026.

#### Site Access

Access to the site will be provided via two partial-movement right-in/right-out (RIRO) entrances, one along Chain Bridge Road and University Drive each, connected via an internal new service drive on-site.

#### Site Generated Traffic

The Institute of Transportation Engineers (ITE) Trip Generation, 11th Edition was used to determine the future trips generated by the proposed development as shown in aTable 5. A Mode Split/TDM reduction of 15 percent was applied to the residential uses along with a 10 percent reduction for internal capture between commercial and residential, based on guidance from City staff. It should be noted that the trips associated with the existing single-family home were not removed in the analysis.

aTable 5: Trip Generation for Full-Build, 2026 (ITE 11th Edition; Peak Hour of Adjacent Street)

Net Total Trips with Reductions (Interna	I, Transit, Pass-By)		35	98	133	85	59	143	1,650
Motos:	-								

Note

As shown in the table above after reductions, the proposed development will generate approximately 133 new trips during the AM peak hour, 143 new trips during the PM peak hours, and 1,650 new daily trips on a typical weekday.

#### Site Trip Distribution

The distribution of site trips was based on the 2045 Metropolitan Council of Governments (MWCOG) model as well as existing and anticipated traffic patterns with guidance and input from the city staff. The directional distribution percentages are shown in Figure 23. The traffic assignment for the retail and commercial site trips at the study intersections are shown in Figure 24 and Figure 25 respectively. In addition, the pass-by trips associated with the commercial component of the proposed development is shown in Figure 26.

<sup>[1]:</sup> For Multifamily Housing, ITE 11 does not differentiate between apartment, condo, and townhome; per ITE, subcategory of not near rail transit selected.

<sup>[2]:</sup> The internal trip reduction is based on the smaller of 5% of trips between residential and commercial uses.

<sup>[3]:</sup> Pass-by trips for Shopping Center as described in ITE Handbook, 3rd Edition. The AMpeak hour and weekday daily trip rates were based on the PM peak hour rate minus 10%

<sup>[4]:</sup> The proposed retail use is 4,810 square feet, however in order to be conservative the proposed retail use is assumed to be 5,034 square feet.

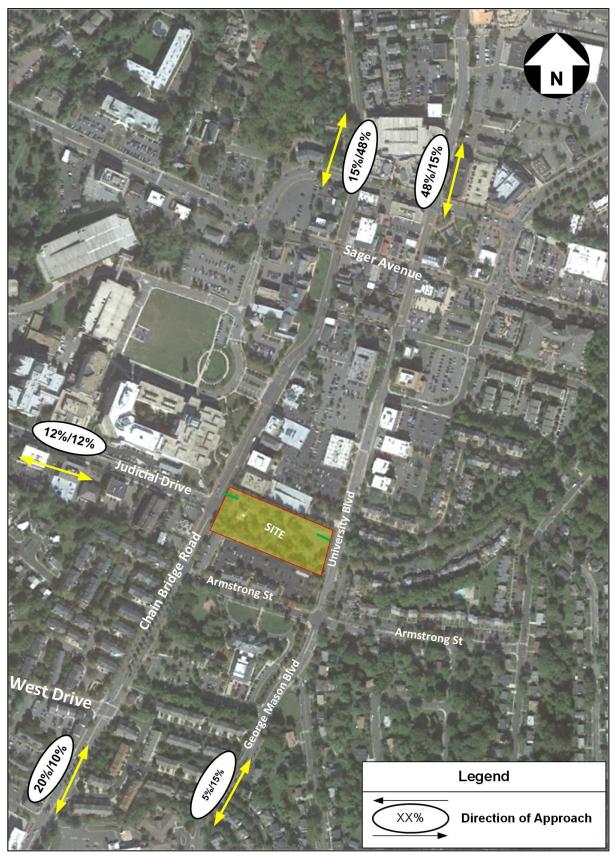

Figure 23: Directional Distribution

# Future with Development (2026) Traffic Volumes

In order to determine the Future Conditions with Development (2026) traffic volumes, the site-generated traffic volumes and pass-by trips were added to the Future without Development (2026) traffic volumes. The Future with Development (2026) peak hour traffic volumes are presented in Figure 27.

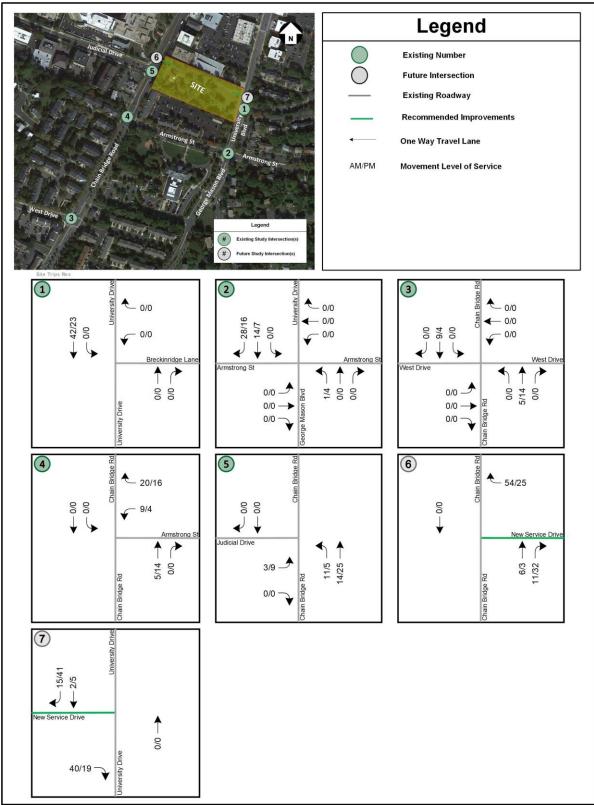

Figure 24: Residential Site Trips (2026)

Figure 25: Commercial Site Trips (2026)

Figure 26: Commercial Pass-by Trips

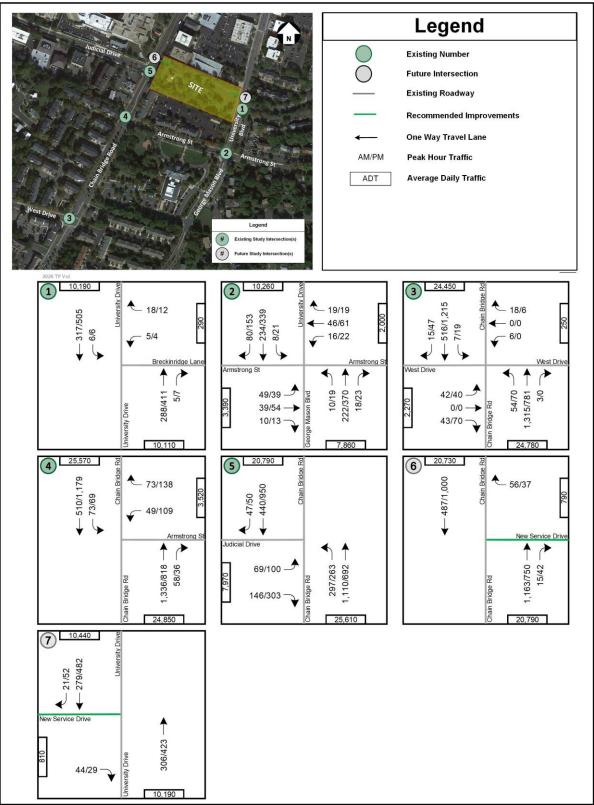

Figure 27: Future with Development (2026) - Peak Hour Traffic Volumes

#### Future with Development (2026) Intersection Analysis

Intersection capacity analysis was performed in a manner consistent with the methodology used for the Future Conditions without Development (2026) analysis. *Synchro Version 11* was used to analyze the study intersections based on the HCM 6<sup>th</sup> edition, and if the output is not available, the HCM 2000 methodology presented in the Transportation Research Board's (TRB) Highway Capacity Manual (HCM) and analysis guidelines provided in VDOT's Traffic Operations and Safety Analysis Manual (TOSAM). The analysis herein includes the level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

Signal phasing and timings were not changed from the future conditions without development. A peak hour factor of 0.92 was used unless the peak hour collected in the field was higher. As discussed in the scope, the heavy vehicle percentages (HV%) were based on the existing counts and a default *Synchro* HV% of 2.0% was utilized for all other lane groups

Per the scoping meeting with the City staff, it would be considered acceptable and/or desirable to achieve an approach LOS D or better for traffic operations using HCM methodology. The results of the intersection analysis are presented in

Table 6 and are expressed in LOS and delay (seconds per vehicle) per lane group. Level of service results are also presented in Figure 28. The detailed analysis worksheets are included in Appendix G.

The intersection capacity analysis results show that the following three intersections have movements that operate below acceptable levels of service during one or more peak hours under Future Conditions with Development (2026):

Intersection 3: Chain Bridge Road and West Drive

<sup>[1]</sup> Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.
[2] #: 95th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.

<sup>[3]</sup> m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

- Eastbound Approach (AM and PM Peaks)
- Westbound Approach (AM and PM Peaks)
- Intersection 4: Chain Bridge Road and Armstrong Street
  - Westbound Approach (AM and PM Peaks)
- Intersection 5: Chain Bridge Road and Judicial Drive
  - Eastbound Approach (AM Peak)

The intersection capacity analysis results are similar to Existing and Future Conditions without Development. The same three intersections that currently operate below acceptable levels of service are expected to continue to operate unacceptably under Future Conditions with Development (2026).

Based on the queuing analysis performed for the Future Conditions with Development, the turning movements at the study intersections are anticipated to have 95<sup>th</sup> percentile queues that can be accommodated within the available storage lengths of the turn bays.

It is to be noted that no signal timings adjustment has been proposed as a mitigation measure for the signalized intersections along Chain Bridge Road. This is because all signals along Chain Bridge Road are coordinated and the side street movements run under split phasing. Any adjustment would impact the overall performance of the intersection and the corridor. These conditions are typical for commuter corridors in Northern Virginia and reflect the prioritization of traffic along the mainlines in order to accommodate the largest possible volume in the area. Therefore, it has a better overall traffic operation than prioritizing all movements equally.

Figure 28: Future with Development (2026) – Levels of Service

# Overall Comparison of Intersection Capacity and Queuing Analysis Results

As described in the previous sections, vehicular capacity analysis was performed for the following seven scenarios:

- Existing (2023) Scenario assumes existing traffic volume based on the counts.
- Future without Development (2026) assumes exiting traffic volume plus additional traffic due to a 1% annual growth rate plus traffic due to planned yet unbuilt two background developments.
- Future with Development (2026) assumes existing traffic plus additional traffic due to a one percent annual growth
  rate plus traffic due to planned yet unbuilt background developments plus traffic generated by the 4131 Chain Bridge
  Road site.

A comparison of the delays and LOS results is presented in Table 7 and the queue comparison for the study scenarios is included in Table 8.

**Table 7: Delay Comparison Table**

#### Conclusions

This report presented the findings of a Transportation Impact Study (TIS) conducted for the proposed development of the 4131 Chain Bridge site in the City of Fairfax, Virginia.

The analysis presented in this report supports the following major finding:

The intersection capacity analysis results for the Future Conditions wit Development are similar to Existing and Future
Conditions without Development. Therefore, the development will have a minimal impact on the traffic operations and
safety of the street network.

Additional assumptions, findings, and conclusions are as follows:

#### TIA Components

- As determined based on discussions with the City, 1.0% regional growth was applied to the Chain Bridge Road / University Drive mainline through movements at the intersection of Chain Bridge Road at Judicial Street as well as at the intersection of University Boulevard/George Mason Boulevard at Armstrong Street volumes.
- A mode split/TDM reduction of 15 percent was applied to the residential uses, as agreed upon with the City.
- The internal trip reduction is based on the smaller of 15 percent trips between residential and commercial uses, as agreed upon with the City.
- The proposed development is anticipated to generate approximately 133 new trips during the AM peak hour, 143 new trips during the PM peak hour, and 1,650 new daily trips on a typical weekday.

#### Infrastructure

- Existing vehicular access is provided via one driveway on Chain Bridge Road.
- Access to the site will be provided via two partial-movement right-in/right-out (RIRO) entrances, one along Chain Bridge Road and University Drive each, connected via an internal new service drive on-site.

#### Non-SOV Elements

Five bus routes provide service in the vicinity of the site, providing regional access to the area.

#### Analysis Results

- Three intersections within the study area operate below acceptable levels of service under Existing Conditions (2023), and the same intersections continue to operate below acceptable levels of service under Future Conditions without Development (2026) and Future Conditions with Development (2026).
- The intersection capacity analysis results for the Future Conditions with and without Development are similar to Existing Conditions.
- Based on the queuing analysis performed for Future Conditions with Development, the turning movements at the study
  intersections are anticipated to have 95<sup>th</sup> percentile queues that can be accommodated within the available storage
  lengths of the turn bays for all the scenarios.
- It is to be noted that no signal timing adjustment has been proposed as a mitigation measure for the signalized intersections along Chain Bridge Road. This is because all signals along Chain Bridge Road are coordinated and the side street movements run under split phasing. Any adjustment would impact the overall performance of the adjacent intersection and the entire corridor. The side street delays are typical for commuter corridors in Northern Virginia and reflect the prioritization of traffic along the mainlines in order to accommodate the largest possible volume in the area. Therefore, the corridor has a better overall traffic operation than prioritizing all movements equally.

#### NOTES on ASSUMPTIONS:

- 1. Synchro files/signal timings will be obtained from the City.
- 2. The scenarios to be included in the study are 2023 Existing Conditions, 2026 Future Conditions without Development and 2026 Future Conditions with Development. The study will analyze AM and PM peak hours.
- 3. In order to project future traffic volumes, a 1.0% regional growth will be applied to the Chain Bridge Road / University Drive mainline through movements at the intersection of Chain Bridge Road at Judicial Street as well as at the intersection of University Boulevard/George Mason Boulevard at Armstrong Street for the period between 2023 and 2026.
- 4. Existing peak hour factors will be based on the traffic counts and utilized on a by-intersection basis. Peak hour factors by intersection in the range of 0.85 to 1.00 will be used for existing scenario. Peak hour factors of 0.92 will be used for all future scenarios if the existing peak hour factor by intersection is less than 0.92. (Peak hour volumes and methodology attached)
- 5. Heavy vehicle percentages (HV%) will be based on existing counts. For any new intersection, the HV% will be based on a default *Synchro* value of 2.0% per movement.
- 6. For any approach, a level of service (LOS) D or better would be considered as acceptable/desirable traffic operation condition. For all approaches, the projected future conditions without development LOS and delay will be maintained in the future with development condition. Will show intersection, approach, and movement LOS.
- 7. 95th percentile queues will be provided from *Synchro*.
- 8. HCM 6th methodology will be utilized where applicable; HCM 2000 methodology will be utilized in the event that HCM 6th methodology is not applicable.
- 9. Transportation Demand Management (TDM) discussion will be provided as a separate document after the TIA.

Net Total Trips with Reductions (Internal, Trai	nsit. Pass-Bv)			35	96	130	84	58	141	1,629

Notes:

<sup>[1]:</sup> For Multifamily Housing, ITE 11 does not differentiate between apartment, condo, and townhome; per ITE, subcategory of not near rail transit selected.

<sup>[2]:</sup> The internal trip reduction is based on the smaller of 5% of trips between residential and commercial uses.

<sup>[3]:</sup> Pass-by trips for Shopping Center as described in ITE Handbook, 3rd Edition. The AMpeak hour and weekday daily trip rates were based on the PM peak hour rate minus 10%.

### C. LOS description

### **TECHNICAL MEMORANDUM**

**Subject: Level of Service Definitions** 

### Introduction

The purpose of this memorandum is to define the level of service (LOS) metric that commonly used as a measure of effectiveness (MOE) for traffic operations.

All capacity analyses are based on the procedures specified by the Transportation Research Board's (TRB) <u>Highway Capacity Manual</u> (HCM), which is currently on its sixth edition. Level of service ranges from A to F. A brief description of each level of service for signalized and unsignalized intersections is provided below.

### Signalized Intersections

Level of service is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay associated with each directional movement. The levels of service for signalized intersections are defined below:

- <u>Level of Service A</u> describes operations with very low average delay per vehicle, i.e., less than 10.0 seconds. This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop. Short signal cycle lengths may also contribute to low delay.
- <u>Level of Service B</u> describes operations with average delay in the range of 10.1 to 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
- Level of Service C describes operations with delay in the range of 20.1 to 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level although many still pass through the intersection without stopping. This is generally considered the lower end of the range of the acceptable level of service in rural areas.
- Level of Service D describes operations with delay in the range of 35.1 to 55.0 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and/or high traffic volumes as compared to the roadway capacity. Many vehicles are required to stop and the number of vehicles that do not have to stop declines. Individual signal cycle failures, where all waiting vehicles do not clear the intersection during a single green time, are noticeable. This is generally considered the lower end of the range of the acceptable level of service in urban areas.
- Level of Service E describes operations with delay in the range of 55.1 to 80.0 seconds per vehicle. These higher delay values generally indicate poor progression, long cycle lengths, and high traffic volumes. Individual cycle failures are frequent occurrences. LOS E has been set as the limit of acceptable conditions.
- Level of Service F describes operations with average delay in excess of 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation, i.e., when traffic arrives at a flow rate that exceeds the capacity of the intersection. It may also occur at high volumes with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such delays.

Level of Service Definitions Page 2

### **Unsignalized Intersections**

At an unsignalized intersection, the major street through traffic and right-turns are assumed to operate unimpeded and therefore receive no level of service rating. The level of service for the minor street and the major street left-turn traffic is dependent on the volume and capacity of the available lanes, and, the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn. The level of service grade is provided for each conflicting movement at an unsignalized intersection and is based on the total average delay experienced by each vehicle. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection.

The unsignalized intersection level of service analysis does not account for variations in driver behavior or the effects of nearby traffic signals. Therefore, the results from this analysis usually indicate worse levels of service than may be experienced in the field. The unsignalized intersection level of service descriptions are provided below:

- <u>Level of Service A</u> describes operations where there is very little to no conflicting traffic for a minor side street movement, i.e., an average total delay of less than 10.0 seconds per vehicle.
- Level of Service B describes operations with average total delay in the range of 10.1 to 15.0 seconds per vehicle.
- Level of Service C describes operations with average total delay in the range of 15.1 to 25.0 second per vehicle.
- Level of Service D describes operations with average total delay in the range of 25.1 to 35.0 seconds per vehicle.
- <u>Level of Service E</u> describes operations with average total delay in the range of 35.1 to 50.0 seconds per vehicle.
- Level of Service F describes operations with average total delay of 50 seconds per vehicle. LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through or enter a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queuing on the minor approaches. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal driver behavior.

### E. Excerpts from Background Traffic Studies

# **ONE UNIVERSITY**

TRAFFIC IMPACT STUDY

November 16, 2018

## SECTION 1 INTRODUCTION

### **Study Scope**

This report presents a Traffic Impact Study (TIS) for the One University project in the Braddock District of Fairfax County, Virginia. The site is located on the north side of University Drive between Chancery Park Drive to the west and Ox Road (VA 123) to the east. The property is zoned PDH-5 and R-1 and is occupied by an existing office building, 46 affordable residential dwelling units (DU), and surface parking. Access is currently provided via five (5) curb cuts along University Drive.

The Applicants, SCG and RISE, is seeking to rezone the subject site and raze the existing uses and redevelop the site with three (3) residential buildings. From the west side to the east side of the property, a 100 affordable DU senior building, a 140 affordable DU building, and a 360 DU student housing building is proposed. Parking for the site would be provided in a combination of surface and structured. Access would be provided via two (2) of the existing curb-cuts thus resulting in the closure of three (3) curb cuts.

The scope of this traffic study was established in consultation with Fairfax County Department of Transportation (FCDOT) and Virginia Department of Transportation (VDOT). It includes an evaluation of existing 2018 conditions as well as future 2022 traffic conditions without and with the proposed development. Additionally, the study includes an analysis of 2040 design year conditions. A copy of the agreed scope is included in Appendix A.

Development proposals within Fairfax County are subject to the published *Requirements Regarding Traffic Impact Analysis Submittals*. In addition, as of July 2012, a project that is expected to generate more than 5,000 daily (24-hour) trips over existing entitlements would trigger a Chapter 870 traffic study and review by VDOT. Therefore, a trip generation compliance letter should be submitted to FCDOT for determination prior to a formal traffic study scoping meeting with FCDOT and VDOT staff. Based on our estimates, this development would not trigger a full Chapter 870 review as shown in the compliance letter contained in Appendix B.

#### **Purpose**

The purpose of this traffic study is to evaluate the potential impacts of the proposed redevelopment on the surrounding and adjacent transportation network and, where necessary, identify potential mitigation measures to mitigate possible impacts. For purposes of this study, a four-year horizon period (year 2022) was analyzed.

This study was conducted in accordance with both Fairfax County's "Recommended Contents of Traffic Impact Studies" and the VDOT Traffic Impact Analysis Regulations Administrative Guidelines 24 VAC 30-155. As mentioned previously, a formal scoping meeting was held with FCDOT and VDOT. A copy of the agreed upon scoping document is in Appendix A.

## SECTION 2 BACKGROUND INFORMATION

### **Description of Proposed Development**

The Applicant (RISE & SCG) proposes to redevelop the existing 46 residential units and 16,689 SF of office into 100 age-restricted affordable (62 years+) DU, 140 affordable housing DU, 362 DU and student housing building. The site is located within the Fairfax Planning District, specifically the George Mason Community Planning Sector, of the Fairfax County Comprehensive Plan. This planning sector is primarily composed of land owned by George Mason University (GMU) and established residential neighborhoods.

The subject property is bounded by primarily residential development to the west, north, and east sides. To the south of the site are the George Mason University athletic facilities. The site is located on the border between Fairfax County and the City of Fairfax. Development located north of the site falls within the City of Fairfax limits while south is located in Fairfax County. The site is immediately adjacent to the GMU campus and within walking distance of downtown Fairfax.

For purposes of this study, the development was assumed to be built and occupied by 2022.

#### **Site Location**

The subject site is bounded by University Drive to the south and Ox Road to the east, as shown in Figure 2-1. Access to the existing office uses is provided via the one (1) westernmost curb cut along University Drive. Access to the existing residential uses is provided via four (4) curb cuts to the east of the office along University Drive.

### **Description of Parcel**

The subject site consists of two (2) parcels totaling approximately 10.77 acres. These parcels are identified as Tax Map Number 57-3 ((1)) 11A and 11B and 57-4((1)2B. The property is currently zoned PDH-5 and R-1. As proposed, the site would be rezoned to PRM (Planned Residential Mixed Use). A site plan reduction is shown on Figure 2-2.

### **Fairfax County Comprehensive Plan**

As noted previously, the subject site is located within the Fairfax Planning District of Area II of the Fairfax County Comprehensive Plan. More specifically, the site is located within the George Mason Community Planning Sector. The George Mason Community Planning sector is located between the southwestern boundary of the City of Fairfax, Roberts Road, Braddock Road, and Shirley Gate Road.

The subject property is planned for public facilities, institutional, and governmental per the Planmap.

## SECTION 5 TRIP GENERATION, TRAFFIC DISTRIBUTIONS & ASSIGNMENTS

#### **Site Trip Generation**

The number of weekday AM and PM peak hour trips would be generated by the proposed site were calculated based on the standard rates and equations published by ITE in the <u>Trip Generation Manual</u>, 9<sup>th</sup> Edition.

As shown in Table 5-1, the proposed development (602 residential units) is estimated to generate 260 AM peak hour trips (52 in and 208 out) and 327 PM peak hour trips (213 in and 115 out) upon completion and full occupancy by 2022. These estimates account for a non-auto mode split reduction.

It is noted that trip estimates assumed in this study provide a very conservative analysis. The residential portion of the development is comprised of student, senior affordable, and family affordable housing options. These uses generate less traffic versus standard market-rate housing during peak periods since they are very multimodal oriented. Table 5-1A provides additional data from the ITE <u>Trip Generation Manual</u> 10<sup>th</sup> Edition on expected trips associated with senior housing and student housing.

As shown Table 5-1A, when compared to market rate multi-family apartments housing senior housing would generate approximately 9% to 52% fewer trips and student housing would generate 62% to 64% fewer trips. Further, while no ITE rate currently exists for affordable housing, the trip generation characteristics of this type of housing also generally lower than market rate apartment developments.

<u>VDOT Chapter 870.</u> For determination of VDOT Chapter 870 compliance the published ITE rates are used without reductions for non-auto use. As shown on Table 5-1, the proposed development would generate approximately 4,238 unadjusted weekday daily (24-hour) trips and is below the 5,000 trip threshold that would trigger a full Chapter 870 review.

Non-Auto Mode Shares. For purposes of this study, residential peak hour trips are based on the ITE Land Use Code 220 with the typical non-auto mode shares that would be acceptable to FCDOT and VDOT. The Fairfax County non-auto mode share goal for non-Transit Orientated Development (TOD) is 15 to 20 percent. For purposes of this assessment a conservative 15% was assumed.

Site trips generated by the existing uses were removed from the network based on vehicle traffic counts conducted at each existing driveway and the peak hour directional splits of Ox Road. The resulting existing trips removed are shown on Figure 5-1.

#### **Site Traffic Distribution & Assignments**

Trip distributions for the proposed development are based on recent traffic counts, the surrounding road network, local knowledge and engineering judgement. The following trip distributions were assumed for the proposed residential development trips.

To/From the North on Ox Road:	43%
To/From the East on University Drive:	5%
To/From the West on University Drive:	2%
To/From the East on Braddock Road:	15%
To/From the South on Ox Road:	20%
To/From the West on Braddock Road:	15%
Total:	100%

The peak hour vehicle trips shown in Table 5-1 were assigned to the public roadway network according to the directional distribution described above. The resulting site generated trips are shown on Figure 5-2.

It is noted that additional pedestrians were also assigned to the intersection of University Drive/Ox Road to account for the increase in students traversing between the proposed student housing and GMU.

#### **Site Access and Driveway Spacing**

Access to/from the site is proposed to be provided via two (2) curb cuts along University Drive. The proposed development would result in the closure of three (3) curb cuts, thus consolidating access. The eastern site driveway (Intersection #5) would serve as the primary access location. The western site driveway (Intersection #2) would serve a small portion of residents of the age restricted building onsite and small surface parking lot intended for the conference room in the affordable building. Interparcel access would be provided connecting the four (4) buildings internally.

Driveway spacing from the signalized intersection of Ox Road/University Drive is shown on Figure 5-3. Adequate spacing exists, per Appendix F of the <u>VDOT Road Design Manual</u>.

### **Transportation Impact Study**

## **Fairfax County Judicial Complex**

Fairfax County, Virginia

January 30, 2023

#### Prepared for:

Fairfax County
12000 Government Center Parkway
Fairfax, Virginia 22035

#### **Executive Summary**

The following report presents the findings of a Transportation Impact Study (TIS) conducted for the proposed redevelopment of the Fairfax County Judicial Complex site in Fairfax County, Virginia. This study was developed in accordance with guidelines and recommendations set forth by the Virginia Department of Transportation (VDOT) and Fairfax County Department of Transportation (FCDOT) and with input from the City of Fairfax.

This study was prepared in accordance with the best professional practices and standards in order to assess the impact of the proposed redevelopment on the surrounding transportation systems and recommend improvements to lessen or negate those impacts. This transportation impact study involves the evaluation of anticipated roadway conditions with and without the proposed redevelopment and recommends possible transportation improvements and strategies to offset both the impacts of the increase in future traffic demand and the changes in traffic operations and characteristics due to the redevelopment. This transportation impact study serves to assist public officials and developers to balance interrelations between efficient traffic movements with necessary access.

#### Site Location and Study Area

The site is located north of Judicial Drive, south of Main Street (Route 236), and west of Chain Bridge Road (Route 123) in Fairfax County, Virginia. The site is located in the county Government Center Community Planning Sector of the Fairfax Planning District.

For the purposes of this study, the analysis presented herein includes 15 existing study intersections (12 external intersections and three (3) internal intersections).

The study intersections are as follows:

- 1. Main Street and Judicial Drive
- 2. Main Street and West Street
- 3. Main Street and Chain Bridge Road
- 4. Chain Bridge Road and Sager Avenue
- 5. Chain Bridge Road and Fairfax County Judicial Center Entrance
- 6. Chain Bridge Road and Judicial Drive
- 7. Chain Bridge Road and Armstrong Street
- 8. Judicial Drive and Restricted Lot Entrance (ins only)
- 9. Judicial Drive and Restricted Lot Exit (outs only)
- 10. Judicial Drive and Leonard Drive
- 11. Judicial Drive and Jones Street
- 12. Judicial Drive and Page Avenue
- 13. Page Avenue and Massey Drive (internal)
- 14. Page Avenue and West Street (internal)
- 15. West Street and Fairfax County Judicial Center Entrance (internal)

Furthermore, the intersections of Main Street and Railroad Avenue, and Chain Bridge Road and North Street were included in the analysis network (*Synchro*) files for analysis purposes, but they are not study intersections and therefore are not included in this document.

#### Future Conditions with Development (2025)

Phase 1 of the Fairfax County Judicial Complex redevelopment is anticipated to be fully constructed and in operation by 2025.

#### Site Description

The Fairfax County Judicial Complex site will be redeveloped in two (2) phases: 2025 and 2041. Phase 1 (2025) is planned to consist of Building 1 only, which includes 80,892 SF of office uses and 43,605 SF of government related uses (records and evidence storage).

Figure 21 illustrates the final development plan for Phase 1.

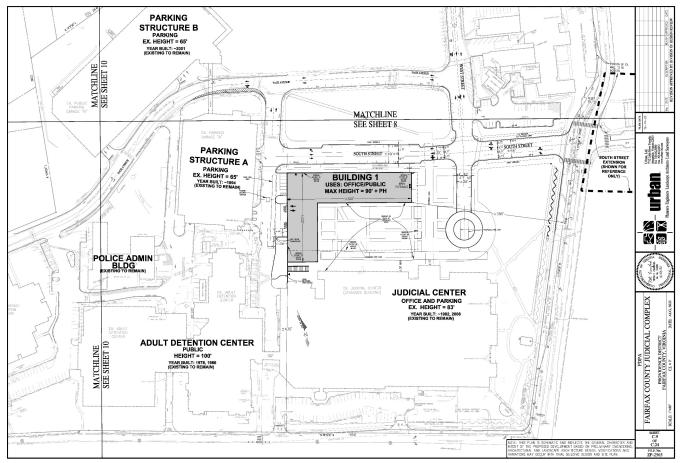

Figure 21: Fairfax County Judicial Complex Phase 1 Development Plan

#### Site Access

Site access will continue to be provided via three (3) full access driveways: one (1) on Judicial Drive, one (1) on Main Street, and one (1) on Chain Bridge Road. The site will continue to be accessed via the existing entrances on Judicial Drive and Main Street. The existing entrance along Chain Bridge Road will be shifted north to align with the proposed South Street extension. The South Street extension was not anticipated to be in place by 2025.

#### Site Generated Volumes

The Institute of Transportation Engineer's (ITE) *Trip Generation Manual*, 10<sup>th</sup> Edition, was used to determine the trips generated by the proposed development during the AM and PM peak hours, as well as the typical number of weekday daily trips associated with the site.

The proposed development's site trip generation for Phase 1 is shown in Table 8.

As discussed during the scoping meeting, a TDM/mode split reduction of 15 percent was applied to the trip generation as agreed upon by VDOT and FCDOT.

**Table 8: Trip Generation** 

				Weekday							
		ITE Land Use Code		ΑN	l Peak H	lour	PΝ	lour	Daily		
		Trip Generation, 10th Ed.	Quantity	In	Out	Total	In	Out	Total	Total	
Existing De	velopme	ent (Proposed Building 1 Uses Only)									
Industrial	151	Mini-Warehouse	15,690 SF	1	1	2	1	2	3	24	
Office	710	General Office Building	61,965 SF	73	12	85	12	60	72	667	
		Existing Deve	Iopment Site Trips	74	13	87	13	62	75	691	
Proposed D	evelopn	nent (Building 1 Only)									
Industrial	151	Mini-Warehouse	43,605 SF	2	2	4	3	4	7	66	
Office	710	General Office Building	80,892 SF	89	14	103	15	78	93	864	
		Building 1 Site Trips W	ithout Reductions	91	16	107	18	82	100	930	
		Mode Split/TDM Reduction	15%	-14	-2	-16	-3	-12	-15	-140	
		Building 1 Site Trip	s With Reductions	77	14	91	15	70	85	790	
		Difference (Pr	3	1	4	2	8	10	99		

As shown, the proposed Phase 1 development is anticipated to generate approximately 91 trips during the AM peak hour, 85 trips during the PM peak hour, and 790 trips on a typical weekday after TDM reductions.

#### Site Trip Distribution

The distribution of site-generated trips was based on the 2045 Metropolitan Washington Council of Governments (MWCOG) model, the roadway network, site access, anticipated traffic patterns based on the proposed use, and input from VDOT and FCDOT staff and is shown in Figure 22.

Figure 22: Trip Distribution

#### Future with Development (2025) Traffic Volumes

The Future with Development (2025) traffic volumes were determined by removing existing trips associated with the current building uses and adding the site traffic volumes to the Future without Development (2025) traffic volumes. The removed trips are shown on Figure 23. In order to project future traffic volumes on the roadways in the vicinity of the development, site traffic was distributed to the roadway network. The site traffic volumes are shown on Figure 24. The Future with Development (2025) traffic volumes are shown on Figure 25. The Phase 1 percent site trips in terms of the 2025 total future volume are shown on Figure 26.

It should be noted that the Future with Development (2025) traffic volumes at the internal intersections (Intersections 13, 14, and 15) vary from the Future without Development (2025) traffic volume, as the internal configuration of the site will be modified with the redevelopment.

The lane configuration for the Future with Development (2025) scenario is shown in Figure 27.

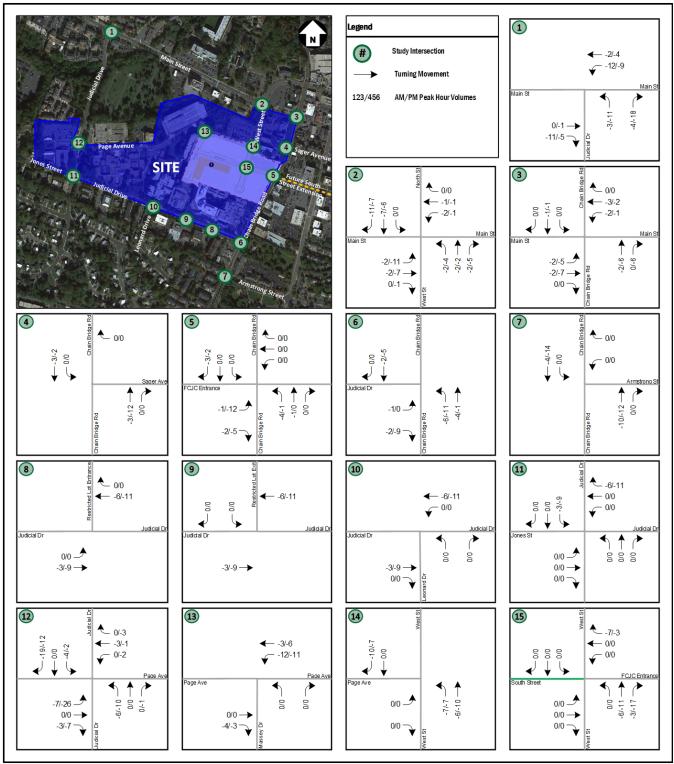

Figure 23: Removed Existing Site Trips

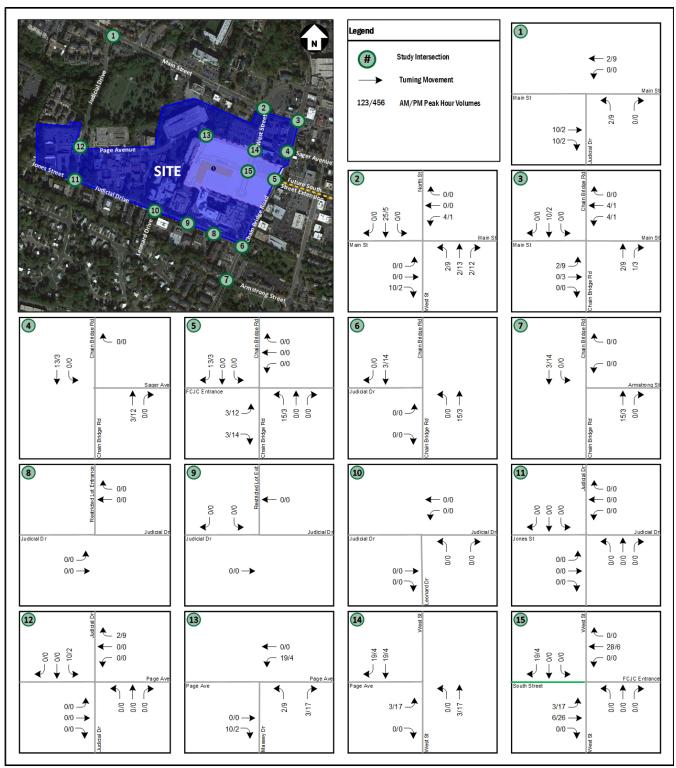

Figure 24: Phase 1 Site Trips
